- 42. (New) A method of enhancing one or more digital images from a plurality of digital images that are provided by different film scanners and different film types, comprising:
- a) receiving two or more source digital images that are provided by the film scanners from a particular film type;
- b) using the pixels of the received source digital images to accumulate noise statistics related to particular combinations of film scanner and film type that produced the digital images;
- c) calculating a noise characteristic value based upon the accumulated noise statistic; and
- d) using the noise characteristic value and the received source digital images to respectively calculate enhanced digital images for the two or more of the received source digital images.
